

Project Database Description: Most of the database is dependent on the existence of user accounts. Most features in the database are tied to user accounts, apart from groups, which can have multiple user accounts tied to them. The database schema is fairly simple; a user can be part of a group, which can have various attributes (rent, other group debts, groceries, chores, etc) associated with it. Users can also have personal debts associated specifically with them (more specifically, between users.)

Database Design Diagram: Please see `database_diagram.pdf`, also on the repository.

SQL Scripts: The SQL script to create the database schema is located at `deployment.sql`, and the script to populate it is located at `dummy_db_data.sql`.
